1 INTRODUCTION

This document describes the installation and use of the Digigram PCI Express ALP-AES67 card under Windows and Linux.

This card is part of the ALP-X professional sound cards range.

Copyright 2024 Digigram. All rights reserved.

No part of this manual may be reproduced without the prior consent of Digigram. This reservation includes photocopying, translating and/or reformatting the information contained in this manual.

Everything possible has been done to ensure the greatest accuracy, however Diagram cannot be held liable for any error or omission and reserves the right to make modifications and improvements without prior notice.

Digigram and the Digigram logo, ALP-AES67 are trademarks or brand names of Digigram Digital. All other marks are owned by their respective companies.

2 IMPORTANT NOTICE

Certifications

The product is currently being certified.

This product has been designed in accordance with the following standards:

- EMC Directive 2014/30/EU.
- FCC Rules Part 15, Subpart B.

To ensure compliance with the standards listed above, the following rules must be followed:

- The cable supplied must not be modified.
- The additional cables used must have their respective shielding connected at each end.

Caution

An electrostatic discharge (ESD) can damage the card components. Take the following precautions to avoid such damage when handling the card:

Connect the card and everything entering into contact with it to the earth potential by providing a conductive surface and discharge paths. Take these precautions as a minimum:

- Unplug all power and signal sources.
- Place the card on an earthed conductive work surface.
- Connect to the earth potential using an anti-static strap or by holding an earthed object.
- Earth all the tools entering into contact with the card.

Given the shortened length of the PCI EXPRESS[™] connector and the resulting lack of mechanical stability, we strongly advise against transporting the cards installed in a computer, unless its chassis or case has a device for holding the card firmly in place to avoid material damage.

3 BOX CONTENTS

Thank you for purchasing a DIGIGRAM sound card in the ALP-X range.

The box contains:

- The ALP-AES67 sound card equipped with a low-profile bracket (79.2 mm),
- The expansion card for 2 Eth ports equipped with a low profile bracket (the expansion card can be linked to the main board via the flat ribbon cable).
- a standard height bracket (full height: 120 mm) that can be fitted instead of the low profile one, and that receives the four Eth ports

4 GENERAL CHARACTERISTICS

ALP-AES67 is a low profile PCI EXPRESS[™] x1 sound card. It can be inserted into and therefore operate in PCIe® x1, x4, x8 or x16 slots.

4.1 Main hardware characteristics

- Low profile PCIe x1
- Two Gbps Eth ports of the main board (PCIe slot).
- Two additional ports on the expansion board.
- The main board and the expansion board can have their own low profile brackets.
- The main board and the expansion board can use the same standard height bracket.
- Inter-card synchronisation

4.2 Main software characteristics

- 64 playback channels & 64 recording channels at 44.1 and 48 kHz
 32 playback channels & 32 recording channels at 88.2 and 96 kHz
 16 playback channels & 16 recording channels at 176.4 and 192 kHz.
 Simultaneous acquisition and playback in PCM (8, 16 and 24 bit)
- The available Eth ports can be used in switch or redundant mode

- Low latency multi-card and multi-applications drivers
 Wasapi/DirectSound, and ASIO under Windows
 Alsa driver under Linux
- "ALP-X Manager" application installed with the Windows driver
- Embedded WEB server for configuration of the network and stream parameters

5 REQUIRED CONFIGURATION

5.1 Required hardware configuration

There are no particular hardware restrictions in terms of PC on using the ALP card and its driver. The PC can have standard height or low profile PCIe card slots.

A PCI EXPRESS[™] (PCIe[®]) x1, x4, x8 or x16 slot must be available to plug in the card.

The processing power and memory required depend mainly on the operating system and the applications used on the PC.

Note: The driver of the card reports to the OS that it does not manage the Sleep mode. As a consequence, the PC should not go to sleep mode.

In case the PC goes to sleep mode under Windows, please proceed as follows to disable the sleep mode.

The windows sleep mode for the PCIe bus must be disabled.

Go to Windows Settings, System, and select "Power & sleep".

Select Never" for the option "Put the computer to sleep".

← Settings		- □ ;
û Home	Power & sleep

5.2 Necessary software configuration under Windows

ALP cards operate under Windows from 64-bit versions of Windows 10 from version 20H2.

To use your ALP-X card, you must install the driver included in the installation kit "ALP-X Kit". Download the latest version from the digigram website from the <u>ALP-AES67 card support page</u>.

This driver supports all the ALP cards.

The "ALP-X Kit" installer is used to install the following components:

- a 64-bit WDM driver offering the WASAPI and DirectSound application interfaces,
- an ASIO driver (32 bits and 64 bits), with its "ALP-X ASIO Settings" configuration interface. Installing this component is optional,
- the "ALP-X Manager" application, which serves to adjust/view the ALP-X cards settings.. Installing this component is optional.

In your Windows system, It may be necessary to allow the applications to access the input audio devices of the sound cards. Please proceed as follows:

• Go to the Windows Settings, and select *Privacy*.

- Select "Microphone"
- Activate the option "*Allow apps to access your microphone*" as shown here-after:

← Settings	- 🗆 ×
டை Home	Microphone
Find a setting	Allow access to the microphone on this device
Privacy	If you allow access, people using this device will be able to choose if their apps have microphone access by using the settings on this page. Denying access blocks Windows features. Microsoft Store apps and most deskton anns from accession the microphone.

RE Account info	If an app is using your microphone, you will see this icon: \clubsuit
g ^Q Contacts	

It is also necessary to have the "Windows Audio Endpoint Builder" running under Windows so that the WASAPI audio devices can be used.. On some Windows setups, this service may not be activated by default.

To check this, go to the Computer Management panel, Services, and browse to the line Windows Audio Endpoint Builder.

5.3 Necessary software configuration under Linux

ALP cards are supported under the following Linux distributions, from the mentioned versions: **Ubuntu**:

20.04 - kernel 5.15

22.04 - kernel 6.5

Debian

11 - kernel 5.10

12 - kernel 6.1

RHEL 9

kernel 5.14

In case you need to run the driver under another Linux distribution, please contact Digigram to get the source code.

In case you experience issues for compiling / running the driver on your Linux distribution, we propose a service to provide you with the appropriate driver; please contact Digigram.

6 HARDWARE INSTALLATION

Given the shortened length of the PCI EXPRESS[™] connector and the resulting lack of mechanical stability, we strongly advise against transporting the cards installed in a computer, unless it features a specific device for holding the card firmly in place to avoid material damage.

The card must be inserted in the computer before installing its driver.

6.1 Preparing the card

Before attaching the card in the computer, make sure the card has the right bracket (low profile or standard profile).

Standard height configurations

By default, the card is delivered with the standard profile bracket mounted.

Low profile configurations

The card can be used with or without the expansion board. The expansion card does not need a PCIe connector, but occupies the slot of a PCIe card, and it can be installed on either side of the ALP-AES67 board.

TABATATAT	Install the low profile bracket on the main board, and screw it. If you need to use the expansion board, install the other low profile bracket on it.
	If you need to use the expansion board, gently insert the ribbon cable on the connector (blue section of the ribbon cable face up) and close the clip that holds the connection cable in place.
	Position the radiator on the main board, and screw it on the back of the main board (4 screws).
	On the table, place the expansion board below the main board,

6.2 Installing the card in the PC

Insert the card in the available PCIe slot and press to position it firmly. In case the card is used with its expansion board, and with low profile bracket,

• place the expansion board below the main board,

• place them in the PC (only the main board is inserted a PCIe slot).

Tighten the screw(s) fixing the bracket(s) to the chassis or lock the card(s) using the device provided for this purpose on your computer.

The cards must be firmly attached to the PC chassis.

6.3 Internal LEDs

The ALP card features two internal LEDs on the edge of its mother board, as shown below. The state of these LEDs can be seen when the PC cover is open.

If the card and its on-board firmware are initialised correctly, LED 1 must be lit solid green, and LED 2 must flash every second (1 Hz).

If LED 2 flashes faster (twice per second - 2 Hz), this means that the firmware version that has been uploaded to the card is corrupted, and the card is running the backup factory firmware version. It is then necessary to re-install the appropriate firmware version.

7 SOFTWARE INSTALLATION UNDER WINDOWS

IMPORTANT

To install the software, you must have administrator rights on the computer.

Please visit the Digigram website at <u>www.digigram.com</u> to obtain the most recent driver.

Should you use a specific application developed or installed by a Digigram partner, this may mean using a specific driver version. In this case, confirm with your application supplier which driver version to use.

Any driver downloaded from our website has to be unpacked before installing it. Double click on the downloaded file to start the auto-extraction utility. You can choose the default destination (temporary Windows folder) or select another one.

7.1 Very first installation

- Switch off the computer and insert the ALP card(s) in an available PCIe slot.
- Restart the computer.
- Click on Cancel if the "New device detected" wizard appears.
- Double click on the ALP driver installation file "ALP-X Kit vxx.exe"

7.2 Updating the driver version

If you want to install a new driver version, double click on the new driver installation file "ALP-X Kit vxx.exe" (see the detailed procedure in the hereinabove chapter "<u>Very first installation</u>").

7.3 Updating the firmware

The ALP card features two on-board firmware: the "AES67" dedicated firmware, and the board firmware. Updating the firmware can be done from the AVS-Monitor application (see chapter <u>Firmware update procedure</u>). Both firmware can be updated from this application.

7.4 Verifying the card installation

Once the driver and card have been installed as per the process described hereinabove, you can verify that the card is installed correctly and working properly.

7.4.1 Presence of playback and recording devices

The audio devices exposed by the card driver are visible on the Windows Sound panel. To open it, right click on the loudspeaker icon in the Windows taskbar and select "Sounds":

The audio devices exposed by the card driver are visible from the "Play" and "Record" tabs.

		 Select a recording device below to modify its	settings:
~	ALP PLAY 1-2 DIGIGRAM ALP-AES67 Ready	ALP REC 1-2 DIGIGRAM ALP-AES67 Ready	
	ALP PLAY 3-4 DIGIGRAM ALP-AES67 Ready	ALP REC 3-4 DIGIGRAM ALP-AES67 Ready	
<i>~</i>	ALP PLAY 5-6 DIGIGRAM ALP-AES67 Ready	ALP REC 5-6 DIGIGRAM ALP-AES67 Ready	
	ALP PLAY 7-8 DIGIGRAM ALP-AES67 Ready	ALP REC 7-8 DIGIGRAM ALP-AES67 Ready	
	ALP PLAY 9-10 DIGIGRAM ALP-AES67 Ready	ALP REC 9-10 DIGIGRAM ALP-AES67 Ready	

If the card devices are not listed in the Windows Sound control panel:

- Make sure that the card is inserted correctly in the PCI slot and screwed to the computer chassis.
- Try to uninstall the ALP-X Kit (from the Windows control panel, Applications) and re-install it.

Playback to an output device of the ALP-AES67 can be tested by right clicking on this device and selecting "Test". The VU-meter must then show modulation.

If several cards are installed, their devices have the same names (ALP PLAY and ALP REC), but the name of the card associated with each device differs (different card name, no index for the

first card, and index starting from 2 for the following cards of the same model). In the example below, the first card in the PCIe slot enumeration order is an ALP-AES67, the second card is an ALP442e, and the third card is an ALP882e.

First card: ALP-AES67	Second card: ALP442e	Third card: ALP882e
ALP PLAY 1-2	ALP PLAY 1-2	ALP PLAY 1-2
Digigram ALP-AES67	Digigram ALP442e	Digigram ALP882e
ALP PLAY 3-4	ALP PLAY 3-4	ALP PLAY 3-4
Digigram ALP-AES67	Digigram ALP442e	Digigram ALP882e
ALP PLAY 63-64	ALP PLAY 7-8	ALP PLAY 15-16
Digigram ALP-AES67	Digigram ALP442e	Digigram ALP882e

7.4.2 Card detected by the Digigram ALP-X Manager application

The ALP-X Manager application, installed with the driver, is used to control and/or view the ALP card settings via a graphic interface. This application can be launched from the shortcut created on the desktop or from the start menu, Digigram group. The card must appear as below if it and its driver are installed correctly. Note that a maximum of eight ALP cards can be displayed and handled in ALP-X Manager.

ALP-AES67-11		MASTER
Serial Number	271000000011	
Firmware Version	1.72 (328)	<u>ث</u>
Buffer Size	128 samples	

7.4.3 Card availability under ASIO

If the ASIO driver for the card has been installed (option to be selected during the installation procedure), then the card must be detected and displayed in the ASIO control panel. The control panel can be opened from the ASIO-based software application.

All the present ALP cards must be listed in the "ACTIVE CARDS GROUP" selection list.

💥 ALP-X Asio Settings		- 🗆 ×
HELP		
ACTIVE CARDS GROUP		TO CHANNELS ALLOCATION
ALP AES67 Channels		\$
BUFFER SIZE (latency) 512 samples (10.67ms at 48kHz)	AUDIO ERRORS Playing errors counter	RESET
	Recording errors counter	
SAMPLE SIZE 16 bits	Last Reset	////-//-// //://://
24 bits 32 bits	Boost ASIO priority	OPEN "DIGIGRAM ALP-X MANAGER"

7.5 Adjusting the internal latency of the card

The internal latency of the card is determined by the duration of sample buffers the card exchanges with the PC for playback and recording audio streams. By default, this duration is 32 sampling clock periods (0.67ms at 48 kHz).

The lower the internal latency, the lower the global latency of the card. However, a very low latency may lead to "choppy" audio on slow PCs. In this case it is necessary to increase the internal latency.

The internal latency of the card can be changed by electing the properties of the card, from the Windows Device Manager:

Right click on the ALP card, and select Properties, Advanced. The following window is displayed:

DIGIGRAM ALP-AES67 Properties X General Advanced Driver Details Events Resources Serial Number: 271000000011 Ide DIGIGRAM I : With audio processing time log DIGIGRAM	With audio processing timelog: This option is to be used only for debugging purposes (debugview). 10 384	
(in samples) 64	Internal huffer: Size of the huffers
Internal buffers 2 20 Qty 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1	exchanged between the card and the driver. The size is expressed in samples (ex: at 48 kHz, a value of 48 corresponds to 1ms buffer).
Pre-filled Playback Buffers 2 44.1 48 88.2 96 176.4 192	Values are from 10 samples to 384 samples. It impacts the latency of the driver.
Sampling Rate (kHz) OK Cancel	Internal buffer quantity : Defines the number of buffers used by the driver. This parameter does not impact the latency.
	Pre-filled Playback buffers : This parameter should not be modified. It impacts the latency of the driver.
	Sampling rate : Select the sampling rate of the ALP-AES67 card. The ALP-X Manager application must be closed before selecting a new sampling rate value.

Select the new value, and click on "Ok".

The PC must be restarted.

7.6 Replacing a card

If an ALP card has to be replaced by another one, it is strongly recommended to proceed as follows:

- Turn off the PC.
- Remove the card to be replaced.
- Restart the PC.
- Go to the Windows Device Manager, and select "Sound, video and game controllers". From the "View" menu, select "Show Hidden devices". Select the ALP card that was hidden and select "Uninstall".
- Turn off the PC.
- Insert the new card.
- Restart the PC.

7.7 Changing the order of installed cards

If several ALP cards are installed, and you want to move cards from one slot to another, it is strongly recommended to proceed as follows:

- Turn off the PC.
- Remove the cards to be moved.
- Restart the PC.
- Go to the Windows Device Manager, and select "Sound, video and game controllers". From the "View" menu, select "Show Hidden devices". Select the ALP cards that were hidden and select "Uninstall".
- Turn off the PC.
- Insert the cards in the appropriate slots.
- Restart the PC.

8 UNINSTALLING THE DRIVER UNDER WINDOWS

Proceed as follows to uninstall an ALP driver version.

Please note that uninstalling a version must be done prior to the installation of another version.

කි	From Windows Start menu, open the "Settings" panel
Apps Uninstall, defaults, optional features	Click on the "Apps" icon.
Apps & features Optional features App execution aliases Search, sort, and filter by drive. If you would like to uninstall or move an app, select if from the list. Search, sort, and filter by drive. If you would like to uninstall or move an app, select if from the list. Search, sort, and filter by drive. If you would like to uninstall or move an app, select if from the list. Search, sort, and filter by drive. If you would like to uninstall or move an app, select if from the list. Sort by: Name × Filter by: All drives × S0 apps found \$0 bitwer Microsoft Corporation 8/4/2022 Microsoft Corporation 8/4/2022 Microsoft Corporation 8/20/2022	From the list of installed Apps & features, select ALP-X Kit.
Modify Uninstall	Click on Uninstall. This will remove all the ALP-X components

9 CONFIGURING THE CARD UNDER WINDOWS VIA THE ALP-X MANAGER APPLICATION

This application can be launched from the shortcut created on the desktop or from the start menu, Digigram group.

9.1 Installed ALP cards

When the application is launched, the window below is displayed and shows all the ALP cards installed in the PC.

If another view is displayed, click on the **use is a set of the se**

The following settings are displayed for each ALP card detected:

- its serial number,
- the on-board firmware version,
- the size of buffers exchanged between the driver and the card (see <u>Adjusting the internal</u> <u>latency of the card</u>).

9.2 Sampling clock

The sampling clock of the card is configurable from the Windows Device Manager. The ALP-X Manager application must be closed before changing the sampling clock value.

Open the Windows device Manager, select the item "Sound, video and game controllers", and right click on your ALP-AES67 card to open its "Properties" control panel. Select the appropriate sampling frequency values.

Select OK to apply the changes. You will be prompted to restart the computer.

Click on the clock icon to display the clock settings of each present ALP card.

9.3 Input and output vu-meters

This view displays the vu-meters for all input and output channels.

Input vu-meters reflect the audio modulation received from the AES67 streams routed to the ALP-AES67 card. These are the channels to be acquired from the software application via the recording devices.

Output vu-meters reflect the audio modulation received by the card from each software playback device. Note that the output modulation is displayed even if the AES67 network is disconnected.

The following table lists the various possible settings from the mixer view.

1-2	Vu-meters
1-2	Each Vu-meter displays the input signal peak-meters in dBfs.
STEREO 0 -6 -12 -18 -24 -24 -20 -6 -7 -6.5 -7 -6.5 -7	Note that there is no clipping information that is reported. As a consequence, the clipping threshold adjustment that can be found from "Settings-> Audio meters" has no effect.
	Click on this icon to display the concerned pair of channels as two mono channel strips.
	Click on this icon to display the concerned pair of channels as one stereo channel strip.
1-2	Channel strip name
1-2	Click on the channel strip name and enter a new name.
STEREO	Note: when a channel strip display is changed from mono to stereo, or stereo to mono, the channel stream name goes back to the default name.
	As a consequence, it is recommended to keep the display mode used (mono or stereo) when the channel strip names have been changed.

9.4 Firmware update procedure

The ALP-AES67 card on-board firmware may have to be upgraded, and updates can be supplied by Digigram and prove necessary.

The firmware update has to be done from the AVS-Monitor application, which allows applying a new firmware through the AES67 network. AVS-Monitor is an application from the company Auvitran which is owned by Digigram. It runs under Windows, and accesses the ALP-AES67 card through the AES67 network. As a consequence, the NIC card selected in AVS-Monitor must be connected to the AES67 network.

In case you have not already downloaded this application, click on the button in the right of the "Firmware version" field, as shown on the screen capture below.

AVS-Monitor is constantly updated on Auvitran's WEBsite. It always includes the most recent firmware version for the card. In case the PC running AVS-Monitor is connected to the internet, AVS-Monitor is updated.

When AVS-Monitor is started and the NIC card connected to the AES67 network is selected, AVS-Monitor automatically detects the AES67 products on the network.

To update the firmware of the products, select "Launch Firmware manager" from the "Control" menu.

The Firmware manager application is started.

If the ALP-AES67 card(s) appears with unchecked boxes as shown below, this means that no firmware update is to be done.

If the ALP-AES67 card boxes are checked, then select "Update" on the bottom right of the Firmware Manager window to start the firmware update. Do not shut down the PC hosting the ALP-AES67 card during the firmware update.

A shutdown and restart of the computer hosting the ALP-AES67 card is necessary to take into account the new firmware.

9.5 Creating, saving and loading setting sessions

The current configuration of all settings defined in ALP-X Manager can be saved. Go to the File menu and select "Save session as".

To load a configuration, go to the File menu and select "Open session".

To create a new configuration from blank settings, go to the File menu and select "New session".

9.6 Keyboard shortcuts

Keyboard shortcut	Action	
Session		
Ctrl + S	Save	
Ctrl + Alt + S	Save As	
Ctrl + N	New	
Ctrl + O	Open	

10 ASIO CONTROL PANEL for Windows

The ASIO control panel can be started from the Asio application, from the menu allowing for the settings of the audio device and the ASIO configuration.

The ASIO settings are saved per application. The ASIO driver supports multiple simultaneous ASIO applications, provided that they do not use the same channels.

ACTIVE CARDS GROUP	AST	CHANNELS ALL OCATION
ALP AES67 Channels		\$
BUFFER SIZE (latency)	AUDIO ERRORS	RESET
512 samples (10.67ms at 48kHz)	Playing errors counter	
	Recording errors counter	
AMPLE SIZE 16 bits	Last Reset	////-//-// //://://
 16 bits 24 bits 		
32 bits	Boost ASIO priority	OPEN "DIGIGRA

T 43-3 dai Seling – X	Active cards group/Asio channels allocation
A Kill Come	This section is used to select the input channels and output channels that are managed by the ASIO driver and which can therefore be used by any application based on the ASIO interface.
	For every card selected from the "ACTIVE CARDS GROUP" list, click on the "ASIO CHANNELS ALLOCATION" button and select the channels to Image: Asio Channels all contents in the installed cards from your ASIO application, select "All ALP Boards" from the list of cards. A card that is not used under ASIO can be used from a WASAPI or DirectSound application.
ALP-X Asio Settings HELP ACTIVE CARDS GROUP ALP-AES67 BUFFER SIZE (latency) 256 samples (5.33ms at 48kHz) 512 samples (10.67ms at 48kHz) 512 samples (21.33ms at 48kHz) 1024 samples (21.33ms at 48kHz) 2048 samples (42.67ms at 48kHz)	 Buffer size (latency) This section is used to select the size of audio buffers used by the ASIO driver. This size is given as a number of samples and a cross-reference in duration is indicated for a sampling frequency of 48 kHz. The higher the buffer size, the higher the latency. A small buffer size can lead to breaks in audio throughput on a low-powered machine or on a machine with a high processor load. Buffers sizes followed by the symbol * cannot be selected. A smaller internal buffer size must be selected from the Windows Device Manager, Sound, video and games controllers , ALP-AES67 advanced settings.

SAMPLE SIZE • 16 bits • 24 bits • 32 bits	Sample size This setting defines the format of samples exchanged between the application and the card driver.
Enable direct monitoring control Depth "Digitigitation Boost ASIO priority	Enable Direct Monitoring Control This feature has no impact on the ALP-AES67. The hardware monitoring is not supported.
	Boost ASIO priority This option allows the system to run the ASIO process with high priority, thereby increasing the reliability of this process. Caution, however, this can make other processes unstable.
	Audio errors
AUDIO ERRORS RESET Playing errors counter 0 Recording errors counter 0 Last Reset 2002-07-25 18:03:02	This section is used to visualise current errors for playback and recording via the ASIO driver. Errors frequently reflect too small an ASIO buffer size for the system's possibilities. Should they occur, then the buffer size needs to be increased until there are no more errors.
	Sync status errors reflect clock synchro errors (AES11 external clock, WordClock or inter-card synchro).
	Error counters can be reset to zero by clicking on the RESET button.
	Lastly, a time counter displays the time elapsed since the last counter reset.

11 ALP-AES67 principles

11.1 Embedded routing matrix

The inputs of the on-board routing matrix are:

- 64 playback channels coming from the software playback audio devices used by the application based on the ALP driver running under Windows or Linux.
- 64 channels coming from the network interface 1 (or interfaces 1 & 2 when they are configured in redundant mode). Audio channels are extracted from the IP streams to be received and which are named "Sinks".

The outputs of the routing matrix are:

- 64 channels assigned to the software recording audio devices used by the application based on the ALP driver running under Windows or Linux.
- 64 channels assigned to the network interface 1 (or network interfaces 1 & 2 when they are configured in redundant mode). These channels are the audio sources of the AoIP streams published to the network 0. These streams are named "Sources".

11.2 Clock

The ALP-AES67 can be slaved to the PTP clock, or master PTP clock on the network.

Slave to PTP clock: the source clock is the PTP clock.

Master PTP Clock: the clock source has to be internal, WordClock, or MADI, and the card is elected as Master PTP on the network if its PTP clock has a higher priority than other potential Master PTP clock units on the network.

CONFIGURATION OF THE AOIP PARAMETERS

The network parameters of ALP-AES67 can be configured through its embedded WEB server, which is accessible from any of the two Eth ports.

To access the WEB interface of the ALP-AES67 card, connect the PC network interface to the network your ALP-AES67 is connected to.

The ALP-AES67 Eth ports are by default in DHCP mode. In case there is no DHCP service on your network, the ports are in APIPA mode (Automatic Private Internet Protocol Addressing), with the range of IP addresses 169.254.0.0/16

You can use an application such as MT Discovery to detect the card and access its WEB pages:

Parameter	Description
-----------	-------------

Global				
PTP Domain	Allows to define a specific PTP domain, usually when several PTP masters are required in the same network (default value is 0).			
DSCP	PTP DSCP. Values: 46-EF : PTP AES67 48-CS6: PTP RAVENNA 56-CS7			
	Master			
Manual	This checkbox must be checked to modify the PTP settings			
Priority 1	Main priority value (1= Highest priority; 255=lowest priority)			
Class	Device class. This value should not be modified			
Accuracy	Non modifiable			
Priority 2	Only used if the other parameters do not allow for the election of a PTP master.			
GMID	Non modifiable. Current GrandMasterID (PTP Master)			
Slave only	Forces ALP-AES67 to always be PTP slave			
Delay Mech	PTP Profile related - E2E or P2P			
Announce	PTP announcement interval (1 - 2 - 4 - 8 -16 seconds)			
Sync	0.0625 - 0.125 - 0.25 - 0.5 seconds			
	Status			
GMID	Non modifiable. Current GrandMasterID (PTP Master)			
Lock	Shows if the device is locked to PTP (Locked -Locking - Unlocked)			
Interfaces 1 & 2				
PTP status	Master : Device is Master Slave : Device is Slave Listening : The interface is not used for synchronization			
Statistics	The graph is only active in slave mode. Green curve: shows the audio clock delay vs the current Master PTP clock. Grey curve: shows the network delay vs the current Master PTP clock, before the device synchronisation algorithm.			

12.3 ASIO Clock

This tab allows setting the parameters of the clock that can be generated for MERGING AUDIO DEVICE software synchronization.

If this software is not used in your system, just disable this feature (Multicast clock = Off).

Parameter	Description
Global	
Multicast Clock	Off, On, Auto Allows to enable/disable the multicast ASIO clock. Auto activates the ASIO clock only on the master PTP device.
Address	Multicast address of the ASIO Multicast Clock
DSCP	Allows setting the ASIO Multicast Clock DSCP value: 34 (Default), 46, 48, 56. When using a switch, make sure that the ASIO Clock DSCP has a high value in the switch DSCP to Queue table

Session sources

This page allows for the declaration of session source instances on the ALP-AES67 (transmitters that generate the IP streams).

Click on the button it create a new session.

Parameter	Description
Enable	Enables the selected source (active by default)
ю	Non modifiable (Stream)
Name	Source name (63 characters max).
Output interface(s)	Select the network interface (1, 2, or 1&2 in case of ST_2022-7) used for streaming this session.
Auto-unicast	Automatically retrieves the IP address of the sink (listener) for a unicast connection
Address / User defined	Check "user defined" to manually enter or modify the multicast IP address of the generated stream.
Address sec / User defined	Not accessible if only one Eth interface is enabled. Check "user defined" to manually enter or modify the multicast IP address of the redundant stream (ST-2022-7).
TTL	Time to Live (also called Hop Limit) - this value should not be modified
Payload type	RTP Payload type - this value should not be modified
Codec	L24 - L16 - DSD64 - DSD64_32 - DSD128 - DSD128_32 - DSD256 (bit rate). Note that those values are sampling rate dependent;
Frame size (samples)	Frame size of the current source. Reflects the frame size set from the General settings section.
DSCP	Ip audio stream DSCP value (34: RTP AES67 / 46: RTP Ravenna / 26 / 0)
RefClk PTP traceable	This feature is useful when you want to connect a stream through the Internet (e.g. with two PTP Masters (GPS) at each location). It allows making connections with devices locked to different traceable PTP Masters.

	See also "Ignore refclk GMID" - accept source locked to any PTP master on the Session Sinks section below.	
	Channels	
Channels: Channel count	Number of channels in the stream. The "Channel count" drop down menu allows selecting the number of contiguous channels from the 64 available channels.	
Routing table	contiguous channels from the 64 available channels. The routing table allows for the selection of the content of each channel of the stream, among the 128 possible output channels of the ALP-AES67 internal matrix. The first 64 displayed channels are software playback channels. The following channels are the channels received from declared sinks. In the picture above, the channels to be streamed are channels 3 & 4(named DAW Play 3 & DAW Play 4) from the playback application on the PC. Note that the channels can be selected from the sinks receivers, listed after the DAW channels. The first 64 displayed up to the sinks receiver the the the sinks receiver the the the sinks receiver the the sinks receiver the sinks receiver the the the sinks receiver the sinks	
The URL of the SDP of this session is	Allows saving the Session Description into a file (useful for specific third party devices if manual SDP has to be provided). Note : Devices in 2022-7 mode will produce a 2022-7 SDP, containing both interfaces session parameters. If you load such SDP in a non-2022-7 device, only the session parameters from interface1 will be used.	

12.4 Session sinks

This page allows for the declaration of session sinks (receiver instances) on the ALP-AES67.

<i>8</i>	ø

Click on the button is to create a new session.

Parameter	Description
ю	Non modifiable (Stream)
Label	Sink name (=receiver name)
Source	Drop down menu to select a source (both sap and bonjour advertised sources are listed).
Source: Manual	Allows to manually enter a SDP
Delay (samples)	Playback delay. 0 is an automatic delay (works with devices based on the AES67 technology from Merging Technologies). If set to 0, and when using devices that are not based on the Merging Technologies technology, the playout delay is calculated based on the value a=framecount in the SDP. In any case, the frames must be time aligned; all devices must run an integer number of frames from time zero (epoch).
Ignore refclk MGID: - accept source locked to any PTP master	This feature is useful when you want to connect a stream through the Internet (e.g.with two PTP Masters (GPS) at each location), it allows making connections with devices locked to different traceable PTP Masters. See also RefClk PTP traceable on the Session Sources page.
Ignore refclk MGID: - accept source locked from any PTP master	This feature is useful when you want to connect a stream through the Internet, it allows for connections with devices locked to different PTP domains.
Relaxed check	Allow connection to a source that has less channels
Channels: Channel count	Number of channels in the stream. The associated drop down menu allows selecting the "Channel count" contiguous channels from the 64 available channels. Received channels can be routed towards the DAW recording channels, or towards the declared source streams listed after the DAW rec devices:

	DAW REC 3, DAW REC 4 S4 S5 S5 S6 S7 S8 S9 60 61 62 63 0 1 stereo 1/2 2 1 2 1 Channel 5-6
Channels: Count adapted	To be used if the number of channels does not match
	Session Info
Session status	Status Initializing / Ready The Sink has been created, and waiting for the Source information to connect. Status Started : The Sink is trying to connect to the Source. Status Connected : The Sink is connected to the Source. Status : The Sink can't connect to the source, see the error message for details.
	Interface 1-2
RTP Status	Connection status. The displayed value is the sum of the following error value: 0x10 receiving RTP packets 0x01: wrong RTP sequence id 0x02: wrong RTP SSRC 0x04: wrong RTP payload type 0x08: wrong RTP SAC 0x20 stream has been muted 0x40: Horus implementation - an incoming stream is muted 0x40: Horus implementation - an incoming stream is muted 0x80: ST2022-7 mode only - both interfaces are not receiving RTP packets properly \rightarrow muted Exemple. : Stream muted (0x20) and Wrong payload (4) will be displayed as 0x24
Clock domain	PTP clock type and domain
Address	Multicast IP address of the selected sink
Payload	Payload / Codec / Sampling Rate / Number of channels
SDP	Displays the detailed SDP information on the current stream.

12.5 Ins / Outs

This page allows you to change the name of the Inputs and / or Outputs.

This page allows configuring the routing from the input channels of the internal matrix to its output channels.

ณ์

An input channel can be routed to several output channels.

But multiple input channels cannot be routed to an output channel (no mixing on the output channel).

The input channels of the matrix are listed vertically on the left. The scroll bar on the right of the page allows scrolling down/up.

The output channels of the mixer are listed horizontally. The scroll bar at the bottom of the page allows scrolling right/left.

To access the input channels coming from the received streams, scroll first down until you see the horizontal scroll bar.

12.7 Statistics

This page gives statistics about the sinks (received IP streams).

Parameter	Description
	NMOS General Settings
Enable	Enable or disable the NMOS client, following the Port and Registration server configuration. NMOS must be disabled to modify the registration server settings.
Port	ALP-AES67 NMOS communication port
Flush streamer address on disable	Clears the streamer address when the stream is disabled. This option might be useful with some NMOS servers
	Configure Registration Server
Mode	 Registration Server communication modes : mDNS(Bonjour): Automatic communication to a Registration Server, using Bonjour service (The server needs to advertise with Bonjour Service) Search domain: A search domain needs to be supplied. The search domain associated with the primary network interface is shown as Suggested. Static Address: The registration server is found using the address given in the "Address" field. This is currently the preferred and most common way to establish communication with a NMOS Registration Server. (Sony NMOS CPP, RiedelNMOS,)
Address	When Mode is set to Static Address, this allows the user to enter the server IP address and port (<ip address="">:<port number="">). In other modes, this field only displays information when the communication is established.</port></ip>
Search Domain	When Mode is set to Search Domain, this allows the user to enter a domain (Unicast DNS). In other modes, this field only displays information when the communication is established.
Registration Serve	\mathbf{r} (This section provides status information about the Registration Server)

Server Name / Host	Provided by the Server (with DNS or mDNS). Note that this field may remain empty when Mode is set to static
Address / Port	Server IP address and Port
Registered	True if a registration server can be reached

13 SPECIFICATIONS

13.1 Configuration

Bus/Format	PCI EXPRESS [™] x1 / Low profile (compatible x2, x4, x8, x16)
Dimensions	168 mm × 69 mm x 20 mm
Consumption (+3.3 V/+12 V)	0.4 A / 0.3 A
In operation: temperature/humidity (without condensation)	0°C/+50°C • 5%/90%
Storage: temperature/humidity (without condensation)	-5°C/+70°C • 0%/95%

13.2 Audio characteristics

Sampling frequency	44.1, 48, 88.2, 96, 176.4, 192 kHz (set from Windows Device Manager, ALP-AES67 card properties)
Audio formats supported	PCM: 16, 24, 32 bits

13.3 Connectors

Internal connectors	Inter-card synchronisation
External connectors	4 x Gbps RJ-45 connectors Either located on the standard height bracket, or 2 per low profile bracket (main board, and expansion board). Expansion board may not be connected if the two ports are not required.

13.4 Development environment

Drivers	Windows: WASAPI, ASIO Linux: Alsa
Operating systems supported	Windows 10 from version 1809 Linux (Ubuntu 20.04, 22.04, ebian 11

14 APPENDICES

14.1 LEDs

The ALP card has four green LEDs: two LEDs on the PCB (only visible when the PC is open) and two LEDs on the bracket as illustrated in the diagram below.

Bracket LEDs

Internal LEDs

If the card and its on-board firmware are initialised correctly, LED 1 must be lit solid green, and LED 2 must flash every second (1 Hz).

If LED 2 flashes faster (twice per second - 2 Hz), this means that the firmware version that has been uploaded to the card is corrupted, and the card is running the backup factory firmware version. It is then necessary to re-install the appropriate firmware version.

LED	Description	Behaviour
LED 1	Signals when the card is initialised correctly	Solid green lit

LED 2	Signals if the card is running the last updated firmware or the backup factory firmware version.	 Flashes every second: The card runs the last uploaded firmware version (normal behaviour). If this LED flashes differently, the card runs the backup factory firmware instead of the last uploaded version This last firmware is corrupted in memory and has to be applied again.
-------	--	--

14.2 Connectors

Card equipped with the low profile bracket.

Without the expansion card

With the expansion card (low profile brackets)

Card equipped with the standard profile bracket

Eth connectors

Mode	J1	J2	J3	J4
Switch	Primary	Switch	Switch	Switch
Redundant	Primary	Secondary	Switch Primary	Switch Secondary

Note: Switch and Redundant modes are configured from the ALP-AES67 WEB pages.
